Spec: auto-complete earlier racetrack steps

For Freedom | Admin endpoint QmtFloorScan.asp | From Ed | Oct 6, 2026

Why

Only **4.6%** of this week's floor scans mark a step done in Admin (it was 23% in early September). About **90%** come back "Job N is not at this step on the racetrack yet" (`not_at_step`), and 11,723 of the 11,773 job/step pairs that hit it never cleared. **Decision:** when a job is behind, Admin catches the racetrack up automatically instead of refusing the scan.

What to build

1. When a scan arrives for job J at station S (mapped to work type W) and J is not yet at W: mark every earlier open step on J's route complete, in racetrack order, then mark W complete.
2. **Credit:** only W is attributed to the scanning operator(s). The earlier steps are recorded as auto-completed (no operator), with the triggering scan_id and time.
3. If someone later scans one of those auto-completed steps, accept it as a real completion by that person: replace the auto record and give them the credit. Do **not** answer "already completed - no credit" for an auto-completed step. A step completed by a real person still rejects duplicates as it does today.
4. **Replays:** a repeated scan_id must not run the catch-up twice. Return the original result with replay:true.
5. Only auto-complete steps on the job's own route (skip steps the job does not have). **Suggested guardrail:** if more than 6 steps would be auto-completed, return not_at_step with a reason so a person looks at the job (Ed to confirm the number).
6. Everything else is unchanged: job_not_found, unmapped, and the rejected duplicate.

Response contract

Case	valid	mis_status	reason (logged in the Scans sheet)
Normal completion	true	ok	(blank)
Caught up earlier steps	true	auto_completed	Also marked done, no credit: <step names>
Already done by a person	false	rejected	Existing text
Job unknown / station unmapped	as today	job_not_found / unmapped	As today

Keep returning `pages` as today. The scan script already treats any status other than rejected as credited, so auto_completed needs no change on our side.

Tests

- Job at step 3, scan step 5: steps 3 and 4 auto-completed, step 5 credited to the scanner, status auto_completed.
- Same job, a person later scans step 4: accepted, credited to them, auto flag cleared, status ok.
- Same scan_id sent twice: one catch-up only. Scan a step a person already completed: rejected, as today.

Our side (Ed)

Once this is live I will limit the 15-minute retry sweep (reconcilePending_) to the last 7 days and mark the ~11,700 old not_at_step rows as history. **Do not replay those old scans into Admin:** it would auto-complete steps on jobs that finished weeks ago.

Also for today

- **Map in Admin** (scans in the last 7 days): Quality Control 173 (none marked), Smashing 31, Single Knife 13, B-Pre-Press Book 10, Corner Cutter 1. No scans yet, but they need mapping: Digibinder, Hole Puncher, Renz Puncher, Coiling Machine, C-Pre-Press Book, B-Proof Creations, B-Pre-Press Verified. Receiving and Facility are not scan stations; they use the Two-Minute app.
- **job_not_found:** 44 this week. Check whether any are Gelato job numbers.
- **Retry sweep:** confirm whether the 15-minute reconcilePending_ trigger exists. If it does, it is retrying about 11,700 rows each run.
- **PDF uploader v17:** vendor collision. Two Worlds, Photo Merch and Gelato all label books "8x8", but the trims differ and each needs its own hotfolder (Sabrina reported the misrouting).
